

Known issues with the Firm Yield Estimator version 2.0 and resolutions

Issue: In a single-reservoir system simulation, monthly controlled releases and withdrawals from other users that are entered prior to simulation do not show up on the summary text file.

Resolution: The simulation is correctly accounting for release or withdrawal information during simulation. Only the summary file is incorrect. After running simulation, open text file and manually update the controlled releases and withdrawals by other users to match the information used in your simulation.
